

Attaching Solar Panels to a Canvas Bimini or Dodger Using the “bolt-on” Method

The bolt on kit contains fender washers, washers, nuts and bolts. Refer to diagram to see how the components are assembled.

1. Place the solar panel on the canvas where it is to be mounted. Give it time to be warmed by the sun and nestle into the canvas.
2. Mark each of the grommet holes on the canvas.
3. Puncture the canvas at **one** of the grommet locations with a hole punch or sharp object (nail, all or ice pick). A heated punch will fuse the Sunbrella fabric fibers together strengthening the hole area.
4. Place a fender washer onto the $\frac{3}{4}$ " 10-24 bolt and (optional) apply a small amount of adhesive or silicone around the bolt.
5. Insert the bolt with fender washer through the canvas.
6. Apply a small amount of adhesive or silicone around the bolt sticking through the canvas and place a fender washer on the bolt.
7. Tighten a 10-24 nut on the bolt securing the canvas between the fender washers.
8. Place a small washer onto the bolt (optional)
9. Slide the panel grommet over the bolt, place a second small washer onto the bolt and secure the assembly with a lock nut.
10. With one grommet in place inspect the hole positions for the other grommets to be sure they are in the correct position.
11. Repeat steps 3 through 11 for each solar panel grommet.

Note: Some customers have installed insulation between the solar panel and the canvas to reduce heat on the canvas. Foil insulation (Reflectix) available from hardware stores like Home Depot is an excellent product for this. It comes in a roll, is about 5/16" thick and is composed of a layer of foil a layer of bubble wrap type material and a layer of foil. Simply cut to size and tuck it under the solar panel.

Note: Excess wire can be tucked under the solar panel.

Punch hole with hot tool

Insert bolt with washer

Apply optional adhesive
Secure washer with nut

Place washer & grommet on bolt

Place washer and tighten lock nut

Attaching Solar Panels to Canvas Bimini or Dodger Using the “magnet” Method

The magnet mounting kit contains 8 or 12 high power rare earth magnets and 4 or 6 pieces of double sided tape. Refer to the diagram below to see how the components of the kit are used.

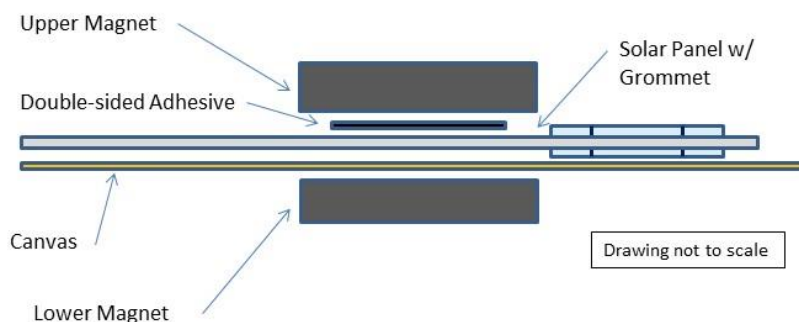

Caution: The magnets are very strong and can cause personal injury. Separate the magnets by sliding them apart carefully in a shear motion. The magnets are brittle so handle them carefully.

Caution: The magnets should be at least 3 feet away from a magnetic compass to avoid interference. Observe the impact of the magnets carefully to be certain the distance is sufficient to avoid affecting the compass.

1. Attach 4 or 6 magnets to the top of the solar panel using the double-sided adhesive dots provided. Attach a magnet in each corner next to the grommets. For longer panels, attach a magnet in the middle of the panel on each side.
2. Place the solar panel on the canvas where it is to be mounted. Give it time to be warmed by the sun and nestle into the canvas. Be sure panels are positioned such that the wires can reach where necessary to connect to the other panels.
3. Attach the second set of 4 or 6 magnets to the underside of the canvas by holding the magnet in the vicinity of the upper magnet. They will find each other. If the magnets repel each other turn the magnet over. A pair of magnets are most effective if they are separated by the panel and a single layer of canvas.
4. To remove the solar panel, slide the lower magnets away from the upper magnets until the attraction force is minimized.

Wiring Your Solar System

The electrical portion of the kit includes a controller, remote display meter (optional), coil of solar wire with MC4 connectors, and an MC4 T-branch connector (two panels or more). The solar wire comes in a coil with a male and a female MC4 connector preinstalled on each end.

Refer to wiring diagrams on the last page.

1. Determine the location of the solar controller and the remote display meter (if included) and mount them as appropriate. The meter should be mounted where it is readily visible.
2. Determine the length of wire needed to run from the solar panels to the controller. **Cut the wire in half or to whatever length needed.** The ends with the MC4 connectors attach to the panels and the other end attaches to the controller.
3. Run two lengths of the solar wire from the solar panels to the controller. The preinstalled MC4 connectors will be at the solar panels.
4. Connect the solar panels in parallel using the T-branch MC4 connectors. Assuming a two panel system, plug in the two positive wires from the solar panels to the T-branch. Plug in the two negative wires from the solar panels to the other T-branch. Plug the T-branch connector into the MC4 connectors on the wires running to the controller.
5. Optional – We recommend a switch be placed in the positive wire running from solar panels to the controller. This switch is used to shut down the system if desired. The switch should be rated at least for the total amperage of the solar array.
6. Connect the remote display meter to the controller using the wire included with the display. Simply plug the meter into the controller and to the display.
7. Connect the controller to the battery bank or banks if you have the dual output controller. Strip off about 3/8" from the end of the wires leading from the battery bank(s) to the controller. Solar wire or other 10-gauge wire can be used for this. A fuse greater than the rated output of the controller on the positive line from the battery bank to the controller is recommended.
 - a. Note: If you have a battery monitor like a Xantrex Link 1000 on board, attach the negative wire from the controller to the house side of the battery monitor shunt not to battery bank.
 - b. The controller is connected to the battery bank first then the solar panel wires are connected. This is because the controller is powered by the battery bank not the solar panels.
8. Strip off about 3/8" from the end of the solar wires leading from the solar panels to the controller. Insert these wires directly into the terminals of the controller and secure by tightening the screws on the controller. **Do not attach the wires to the controller until the controller is attached to the battery bank(s). Be certain the positive wire from the solar panel array is inserted into the positive terminal on the controller. It is suggested that the polarity of the wires be tested with a meter before inserting into the controller.**
9. The LOAD function available with many controllers is not used for our marine battery charging application.
10. Program the controller per the instructions that come with the controller and display. Use the display to program the controller, the Bluetooth app if available or the button on the controller for the Dual Output controller.
11. Your solar system should be operational. Hope you get a charge out of it!

Note: The solar controller will only feed the batteries to a charge level they can accept. Your display will show the voltage and amperage or wattage being provided to your battery bank(s). If your batteries are near full state of charge, the controller automatically cuts back on the charging power and reflects that on the display even though the panels have the capacity to provide more charging power.

Note: You do not have to cover the solar panel when installing or when not using them. A solar panel is similar to a battery in that power is only supplied when there is a circuit. A disconnected panel can be in the sun. Care should be taken when installing the solar panel so the wires do not touch and short circuit the panel or produce an electrical shock.

Caring for Your Solar Panels

1. Clean panels with water and a non-abrasive cloth. Mild soap may be used.
2. Use caution when transporting the panels.
3. Do not bend beyond 30 degrees.
4. Observe proper polarity when connecting the modules into the electrical circuit. Reverse polarity will damage the module.
5. Do not carry the module by the wires.
6. Do not scratch, cut or puncture the module.
7. Do not walk on the module.

These instructions are on the web site under SUPPORT, MANUALS & INFO
